Técnicas de Calefacción Angel Luis Miranda Barreras, Luis Jutglar Banyeras, 2010-04 Técnicas de calefacción forma parte de la colección iniciada por la editorial Marcombo en torno a libros y manuales relacionados directa o indirectamente con la climatización. La colección empezó con dos obras de especial significado: Técnicas de climatización y Técnicas de refrigeración. No podía faltar, pues, un libro dedicado a la calefacción. Tradicionalmente, la calefacción estudia aquellos sistemas en los que se regula sólo la temperatura, puesto que los sistemas en los que se controlan la temperatura y la humedad formarían parte del ámbito de la climatización o el aire acondicionado. En esta obra se ha puesto especial énfasis en los sistemas tradicionales de calefacción, pero nos ha parecido conveniente que el lector tuviera en un mismo libro una información más completa sobre el tema, por lo que hemos incluido también los sistemas en los que se regula la humedad. No hemos olvidado las nuevas tecnologías aplicadas a la calefacción: la geotermia, la calefacción solar, el suelo radiante o la bomba de calor y hemos dedicado también unos capítulos a la regulación de las instalaciones y al estudio del coste de funcionamiento. Por todo ello, creemos que el lector tiene en sus manos un libro que abarca todo el ámbito de la calefacción, sin entrar en excesivos detalles, que serían más propios de un manual.

Manual de Aire Acondicionado y Ventilación Industrial 1 Jorge Serrano, 2013-04-22 El Manual de Aire Acondicionado, en sus 4 tomos pretende orientar el conocimiento de la aplicación y uso del Aire Acondicionado para las instalaciones térmicas de verano e invierno. Los conceptos físicos elementales se consideran ya adquiridos en la formación técnica del lector. En cuanto a la descripción de los componentes y equipos, se describen conceptualmente, profundizando en aquellos de mayor uso. La información contenida es de suma actualidad, y el análisis de carga térmica de verano está aplicado en relación a las últimas normas y datos de cálculo modificadas por I.R.A.M. en 2007 y según Normas ASHRAE. La experiencia profesional y pedagógica me ha permitido realizar por primera vez un desarrollo de cálculo de la carga térmica verano-invierno para la Argentina. Hasta ahora los sistemas de cálculo a disposición de los técnicos y profesionales contemplaban la aplicación de datos climáticos y de radiación solar para el hemisferio Norte y trasladados al hemisferio Sur por similitud. En el presente trabajo se han tomado los valores reales de temperatura y radiación de 118 estaciones meteorológicas de la Argentina y 30 estaciones de otros países. Se ha consultado toda la bibliografía disponible, y las últimas novedades técnicas introducidas en instalaciones térmicas. Como será del conocimiento del lector, de todos los componentes de la obra arquitectónica, (estructuras, fundaciones, cerramientos, carpinterías, solados, revestimientos, etc.), las instalaciones en general constituyen el rubro donde en los últimos años, se han incorporado mayores innovaciones tecnológicas, desde el perfeccionamiento en la fabricación sistemática y robotizada, hasta el uso de ordenadores para el cálculo y secuencia controlada de funcionamiento.

ABC del aire acondicionado M. Àngels Domènech, Ángel Luis Miranda Barreras,2013-06-01 Este libro es una introducción a la climatización en los fundamentos prácticos de esta técnica sin entrar en detalles de especialización. Es muy importante tener en cuenta que el aire acondicionado (y también la calefacción) deben cumplir el reglamento vigente que es el RITE, Reglamento de las Instalaciones Térmicas de Edificios. Este reglamento consta de una serie de artículos y de unas Instrucciones Técnicas, abreviadamente IT, que serán mencionadas alguna vez a lo largo de la obra. Climatizar quiere decir conseguir en un espacio cerrado las condiciones más convenientes para obtener una sensación de confort. Con el nombre de aire acondicionado se designan diversas técnicas y operaciones que conducen a la creación de un clima artificial en un lugar cerrado, que puede ser desde una pequeña habitación hasta un edificio completo. En términos generales, podemos decir que, en verano, el acondicionamiento del aire consiste en extraer calor y humedad del ambiente y en invierno todo lo contrario, o sea, añadir calor y humedad. Durante las épocas templadas es posible que el sistema de aire acondicionado actúe en un sentido o en otro, o que no actúe. De todas formas, la extracción o adición de calor y humedad se hace sobre el aire del recinto que se desea climatizar, bien sea directamente o mezclándolo con el aire frío o caliente que proporcionan los aparatos adecuados. Así pues, el aire acondicionado trabaja sobre el aire interior y exterior del local; es muy importante que conozcamos previamente las propiedades y características del aire. La ciencia que estudia las propiedades del aire se llama Psicrometría; su conocimiento proporcionará una mayor base para comprender los temas técnicos y aplicados que desarrollaremos más adelante. En algunas ocasiones se asocia el aire acondicionado a experiencias personales de incomodidad o, incluso, a procesos infecciosos relacionados con algunos elementos de las instalaciones. Se trata de dos aspectos muy importantes y diferentes. El primero tiene que ver con el diseño de la instalación; el segundo, con el mantenimiento. El profesional del aire acondicionado debe conocer muy bien ambos aspectos de esta rama de la ingeniería. Un sistema de aire acondicionado bien diseñado y con un mantenimiento correcto es cómodo y saludable. Otra cosa es el tema de la climatización pasiva, un campo en el que todavía no se ha dicho la última palabra. La climatización pasiva pretende obtener condiciones de confort sin consumo energético, es un tema apasionante, pero no es en esta obra donde el lector encontrará información sobre esta técnica. Aquí abordamos el estudio de la climatización activa que implica el uso de

maquinaria y, por lo tanto, un consumo energético.
